

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in this application.

Listing of Claims:

Claim 1 (Currently Amended): A portable electronic apparatus incorporating software and having a wireless telephoning function, comprising:

a display for displaying one or more selection screens;

a first memory for storing a plurality of sets of initial data for the software to cope with various kinds of area data and languages so that the portable electronic apparatus utilizes the area data of an area in which the portable electronic apparatus is used and displays on the display in a language corresponding to the area data;

input means for allowing selection from the selection screens entry of area data, a language corresponding thereto, and an additional language used in an area in which the portable electronic apparatus is used; and

a second memory for storing the area data, the language corresponding thereto, and the additional language entered through the input means,

wherein, when the software is initialized, initial data corresponding to the area data, the language corresponding thereto, and the additional language stored in the second memory is selected from the initial data stored in the first memory.

Claim 2 (Original): A portable electronic apparatus as claimed in claim 1, further comprising:

editing means for allowing the selected initial data to be edited by a user; and

storing means for storing the initial data edited by the user in the second memory.

Claim 3 (Currently Amended): A portable electronic apparatus as claimed in claim 2,

wherein, when the software of the portable electronic apparatus having the wireless telephoning function is initialized by use of the initial data corresponding to the area data, the language corresponding thereto, and the additional language as edited by the user, the initial data is checked so that, if incorrect data is found therein, the initial data edited by the user is automatically deleted and the software of the portable electronic apparatus having the wireless telephoning function is initialized by use of the initial data corresponding to the area data, the language corresponding thereto, and the additional language as initially set.

Claim 4 (Original): A portable electronic apparatus as claimed in claim 2, further comprising:

a key that is operated to delete the initial data edited by the user.

Claim 5 (Currently Amended): A portable electronic apparatus as claimed in claim 4,

wherein, when the software of the portable electronic apparatus having the wireless telephoning function is initialized by use of the initial data corresponding to the area data, the language corresponding thereto, and the additional language as edited by the user, the initial data is checked so that, if incorrect data is found therein, the initial data edited by the user is automatically deleted and the software of the portable electronic apparatus having the wireless telephoning function is initialized by use of the initial data corresponding to the area data, the language corresponding thereto, and the additional language as initially set.

Claim 6 (Currently Amended): A portable electronic apparatus as claimed in claim 4,

wherein, when the key that is operated to delete the initial data edited by the user is operated, the initial data edited by the user is deleted and the software of the portable electronic apparatus having the wireless telephoning function is initialized by use of the

initial data corresponding to the area data, the language corresponding thereto, and the additional language as initially set.

Claim 7 (Currently Amended): A portable electronic apparatus as claimed in claim 6,

wherein, when the software of the portable electronic apparatus having the wireless telephoning function is initialized by use of the initial data corresponding to the area data, the language corresponding thereto, and the additional language as edited by the user, the initial data is checked so that, if incorrect data is found therein, the initial data edited by the user is automatically deleted and the software of the portable electronic apparatus having the wireless telephoning function is initialized by use of the initial data corresponding to the area data, the language corresponding thereto, and the additional language as initially set.

Claim 8 (Currently Amended): A portable electronic apparatus incorporating software and having a wireless telephoning function, comprising:

a first memory area for storing software;

a second memory area for storing a plurality of sets of initial data for the software corresponding to area data for an area in which the portable electronic apparatus is used and a first language for use as a language corresponding to the area data so that the portable electronic apparatus is usable in a plurality of areas and languages;

a third memory area for storing an index to the initial data;

a display for displaying one or more selection screens;

input means for allowing selection from the selection screens and entry of the area data, the first language, and a second language used as an additional language;

a fourth memory area for storing area and language data used to initialize the software;

a fifth memory area for storing a flag indicating data is edited by input of the area data, the first language, or the second language through the input means; and

a sixth memory area for storing the area data, the first language, and the second language which are selected using input through the input means,

wherein, when the flag in the fifth memory area is not set, the portable electronic apparatus reads out the area and language data from the fourth memory area, acquires from the third memory area an index to the initial data corresponding to the area and language data, and initializes the software in the first memory area by using the initial data specified by the index and stored in the second memory area, and

when the flag in the fifth memory area is set, the portable electronic apparatus initializes the software in the first memory area by using the area data, the first language, and the second language in the sixth memory area.

Claim 9 (Currently Amended): A portable electronic apparatus as claimed in claim 8,

wherein, when the software of the portable electronic apparatus having the wireless telephoning function is initialized by use of the initial data corresponding to the area data, the first language, and the second language, the initial data is checked so that, if incorrect data is found therein, the initial data input through the input means is automatically deleted and the software of the portable electronic apparatus having the wireless telephoning function is initialized by use of the initial data corresponding to the area data, the first language, and the second language as initially set.

Claim 10 (Previously Presented): A portable electronic apparatus as claimed in claim 8, further comprising:

a key that is operated to delete the initial data input through the input means.

Claim 11 (Currently Amended): A portable electronic apparatus having a wireless telephoning function comprising:

a first memory area storing a software application;

a second memory area storing different sets of initialization data for initializing the software application stored in the first memory area;

a display for displaying one or more selection screens;
an input device operable by a user of the apparatus to select from the selection screens ~~input a selected~~ geographic area and at least one ~~selected~~ language;
a third memory area storing the user-selected geographic area and language; and
control circuitry for initializing the software application by accessing one of the sets of initialization data stored in the second memory area based on the user-selected geographic area and language stored in the third memory area.

Claim 12 (Previously Presented): The portable electronic apparatus as claimed in claim 11, further comprising:

a fourth memory area storing a pre-selected geographic area and language; and
a fifth memory area storing a flag which is set/cleared to indicate that a user-selected geographic area and language are stored in the third memory area and which is cleared/set to indicate that no user-selected geographic area and language are stored in the third memory area, wherein

if the flag indicates that no user-selected geographic area and language are stored in the third memory area, the control circuitry initializes the software application by accessing one of the sets of initialization data stored in the second memory area based on the pre-selected geographic area and language stored in the fourth memory area.

Claim 13 (Previously Presented): The portable electronic apparatus as claimed in claim 12, wherein the input device is further operable by the user of the apparatus to delete the user-selected geographic area and language stored in the third memory area.

Claim 14 (Previously Presented): The portable electronic apparatus as claimed in claim 13, wherein the software application is initialized by the control circuitry after the user-selected geographic area and language stored in the third memory area are deleted based on the pre-selected geographic area and language stored in the fourth memory area.

Claim 15 (Previously Presented): The portable electronic apparatus as claimed in claim 12, wherein incorrect data stored in the third memory area is automatically deleted and the software application is thereafter initialized by the control circuitry based on the pre-selected geographic area and language stored in the fourth memory area.

Claim 16 (Previously Presented): The portable electronic apparatus as claimed in claim 11, wherein the software application comprises an electronic mail application.

Claim 17 (New): The portable electronic apparatus as claimed in claim 1, wherein the one or more selection screens comprise an area selection screen identifying one or more areas for selection using the input means.

Claim 18 (New): The portable electronic apparatus as claimed in claim 1, wherein the one or more selection screens comprise a language selection screen identifying one or more languages for selection using the input means.

Claim 19 (New): The portable electronic apparatus as claimed in claim 8, wherein the one or more selection screens comprise an area selection screen identifying one or more areas for selection using the input means.

Claim 20 (New): The portable electronic apparatus as claimed in claim 8, wherein the one or more selection screens comprise a language selection screen identifying one or more languages for selection using the input means.

Claim 21 (New): The portable electronic apparatus as claimed in claim 11, wherein the one or more selection screens comprise an area selection screen identifying one or more areas for selection using the input means.

Claim 22 (New): The portable electronic apparatus as claimed in claim 11, wherein the one or more selection screens comprise a language selection screen identifying one or more languages for selection using the input means.

Claim 23 (New): A portable electronic apparatus having a wireless telephoning function comprising:

a first memory area storing a software application;

a second memory area storing different sets of initialization data for initializing the software application stored in the first memory area;

a receiver for receiving data designating a geographic area and at least one language;

a third memory area storing the designated geographic area and language; and control circuitry for initializing the software application by accessing one of the sets of initialization data stored in the second memory area based on the designated geographic area and language stored in the third memory area.
